

In-Class Exercise/Demo

In-Class Demo

- We'll practice Redux Animation
- For demo1, review <https://codesandbox.io/s/w0ol90x9z5>
 - Review the code and learn how each animation works
- For demo2, review <https://codesandbox.io/s/jn073>
- For demo 3, review <https://codesandbox.io/s/ww0xkyqonk>
- **Task:**
 - For today's demo, we'll clone these sandboxes as a project and create a page where each can be executed.

In-Class Demo

- Make sure to brainstorm how to approach the solution.
- Discuss your solution with instructor.
- Solution on next slide

In-Class Demo

Solution 1

- Download each codesandbox animation project as zip.
- Unzip and perform npm install to install required dependencies for each project based on the packages version as specified on their individual app. Run each project to make sure they still works the same way as seen in codesandbox.
- Scaffold a react app. Down grade react, react-dom, react-scripts to match the versions on the animation apps using `npm i react@x.x.x`. Install react-router and react-router-dom v4.3.1. Next, drop all three app folders in the main app src. Modify main app.js to have a navigation with three links to display each animation as component.

Solution 2

- You can also create it as a 1 app, all in one folder. Each animation src files in their respective sub folder in the main src.
- Combine all in one single main [package.json](#) (down graded versions as solution 1) and run it as a 1 single app.
